

Lect. # 23

Magnetic Induction

**Magnetic field  $\mathbf{B}$  is directed into plane of page.**

Motional EMF  
 $e_{\text{electro}}$   
Charges in a conductor

$\times \quad \times \quad \times \quad \times \quad \times \quad \times$   
 $\times \quad \mathbf{B} \quad \times \quad \times \quad \times \quad \times$   
 $\times \quad \times \quad \times \quad \times \quad \times \quad \times$

$\times$  feel a magnetic force  
 $\times$  when conductor moves  
 $\times$  in a magnetic field

$\times \quad \times \quad \times \quad \times \quad \times \quad \times$

$$e > 0$$

$\times \quad \mathbf{v} \times \quad \times \quad \ell \quad \times \quad \times$   
 $\times \quad \times \quad \times \quad \times \quad \times \quad \times$   
 $\times \quad \mathbf{F}$

$$\times \quad \vec{F} = -e\vec{v} \times \vec{B}$$

**When rod moves to the left...**

$\times \quad \times \quad \times \quad \times \quad \times \quad \times$   
 $\times \quad \times \quad \times \quad \times \quad \times \quad \times$   
 $\times \quad \times \quad \times \quad \times \quad \times \quad \times$   
 $\times \quad \times \quad \times \quad \times \quad \times \quad \times$   
 $\times \quad \times \quad \times \quad \times \quad \times \quad \times$

In equilibrium

$$\vec{F}_{\text{total}} = 0 = -e(\vec{v} \times \vec{B} + \vec{E})$$

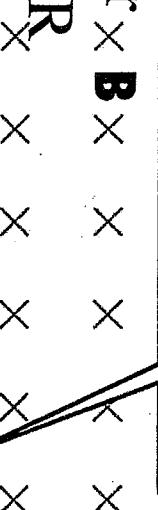

$$\vec{E} = -\nabla \times \vec{B}$$

$$= E_{\text{ind}}$$

**...magnetic force pushes free electrons upward along rod.**

**When rod moving to left  
is in contact with this  
conducting path...**

current in resistor  $\times \mathbf{B} \times \times \times \times \times$   
Motional EMF = IR

EMF = vBL  
Thus  $I = vBL/R$

Faraday's View  
Change of B-flux

In loop in time t

$$\Delta\Phi_m = vBLtL$$

$$\text{EMF} = vBL$$

$$\Delta\Phi_m / dt$$

**...electrons flow clockwise  
around path...**

same EMF as  
motional EMF

**...and conventional current  
flows counterclockwise.**

change

Note flow  
of current  
tries to resist  
change

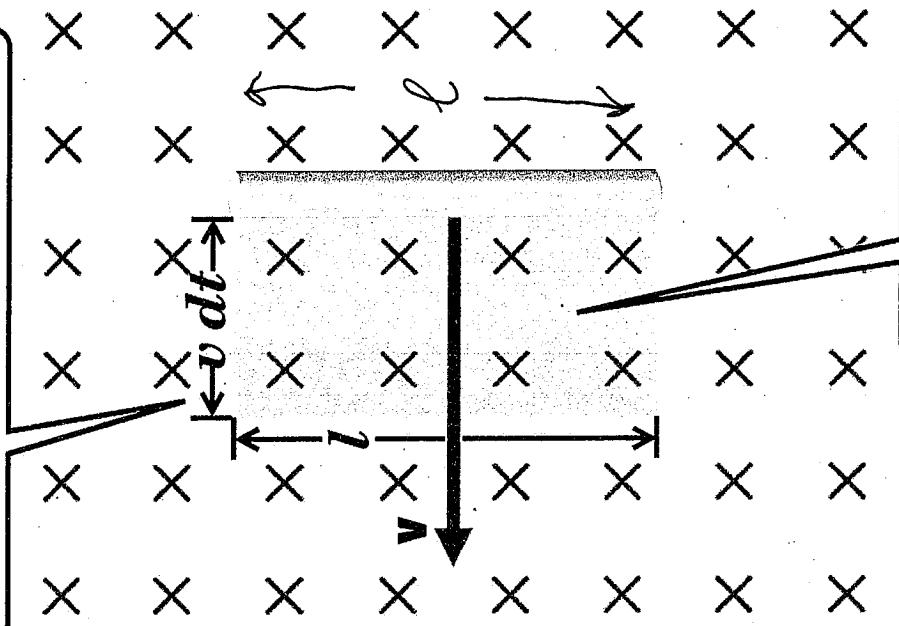

Motional EMF produces

currents that resist change  
in enclosed magnetic flux

(Lenz's Law)

In a time  $dt$ , a rod moving perpendicular to its length...

$$\Delta A = l v dt$$

$$\frac{\Delta A}{\Delta t} = l v = \frac{dA}{dt}$$

$$E_{in} = -\vec{v} \times \vec{B}$$

$$E_m = E_{in} = -N B \frac{d}{dt}$$

$$E_m = -B \frac{dA}{dt}$$

Faraday's Law

even more generally

$$E_m = -\frac{d}{dt} \Phi_M$$

...sweeps through this area  $l \times v dt$ .

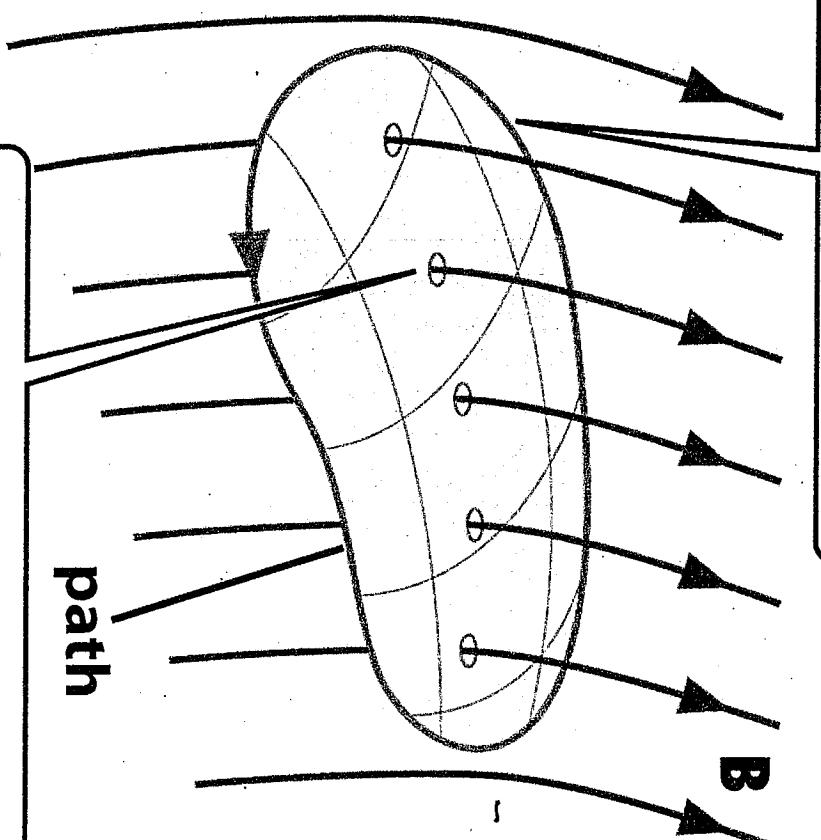

Figure 31-7 Physics for Engineers and Scientists 3/e  
© 2007 W.W. Norton & Company, Inc.

$$\Phi_M = \int \vec{B} \cdot d\vec{A}$$

$$= - \int \frac{d}{dt} \vec{\Phi}_M$$

**Faraday's Law gives the induced emf along a path...**

$$\oint \mathbf{B} \cdot d\mathbf{A} = -\frac{d\Phi}{dt} = \mathcal{E}_{\text{EMF}}$$

...in terms of the magnetic flux intercepted by any surface within that path.

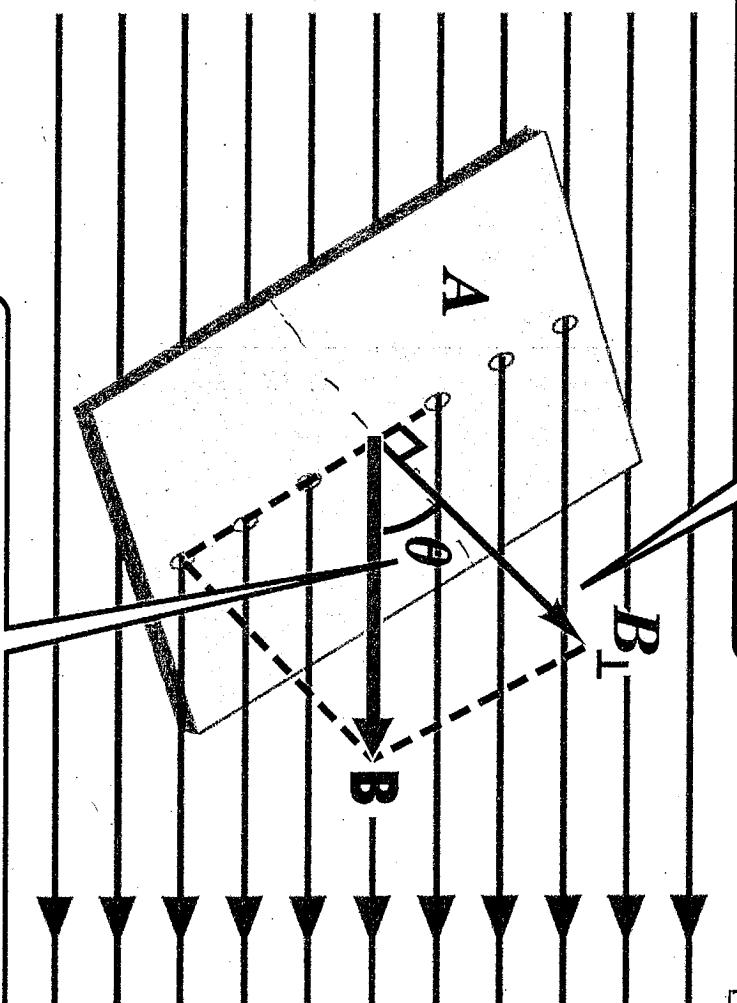

**Component of magnetic field perpendicular to surface is  $B_{\perp} = B \cos \theta$ .**

$$\Phi_m = B_{\perp} A$$

$$= BA \cos \theta$$

One can

change  
magnetic  
flux through  
a surface  
by rotating  
by  
surface

$$\frac{d\Phi_m}{dt} = -BA \sin \theta \frac{d\theta}{dt}$$

if  $B(t)$

$$\dot{\Phi}_m = B(t)A \cos \theta$$

$$\frac{d\dot{\Phi}_m}{dt} = \frac{dB}{dt} A \cos \theta$$

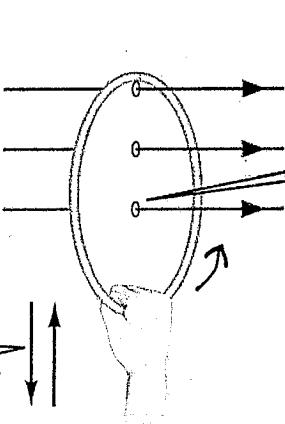

$$= -E_m$$

**θ is angle between magnetic field and perpendicular to surface.**

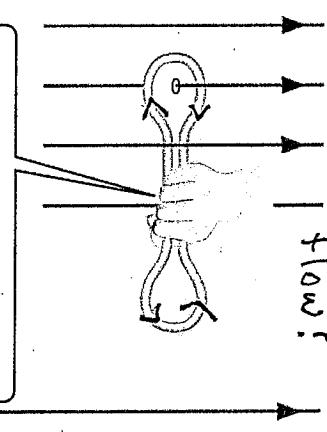

## Motional EMF and Stationary Loop EMF combine together in one compact Law

$$\oint \vec{E} \cdot d\vec{s} = - \frac{d\Phi_m}{dt}$$

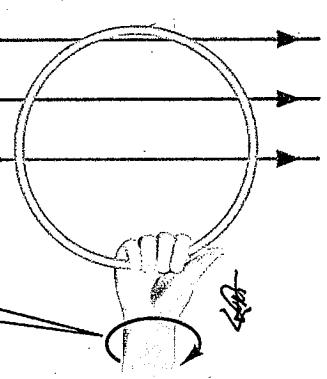

**Flux through loop changes when we...**

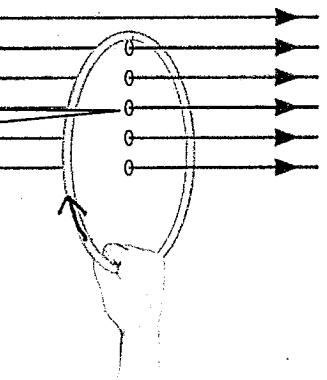

**Faraday's Law which way is current flow?**

**(c)**

**(d)**

**...move loop in or out of magnetic field, ...**

**...squeeze loop, altering its shape, ...**

**...rotate loop in magnetic field, ...**

**...or increase strength of magnetic field.**

Translation through non-uniform field

This Law is true whether the loop moves through a non-uniform magnetic field, deforms, rotates, and B-field

changes in time.

rotation time varying field

- In (a), Does the current flow is the clockwise or anti-clockwise direction?
- (1) clockwise
  - (2) counter-clockwise

## The moving column of blood in an artery...

...is in contact with two electrodes at diametrically opposite points.

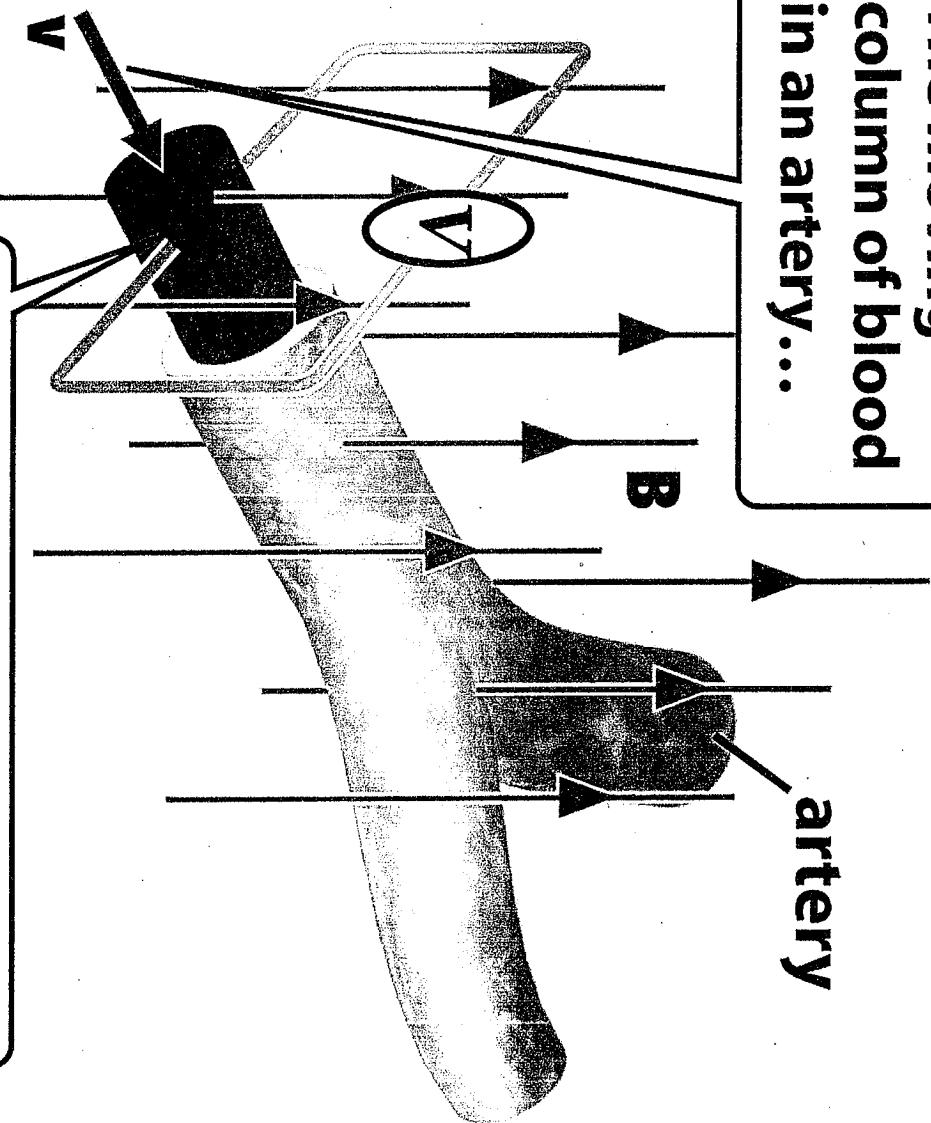

Figure 31-4 Physics for Engineers and Scientists 3/e

Dynamo is used to generate electrical currents from mechanical input power

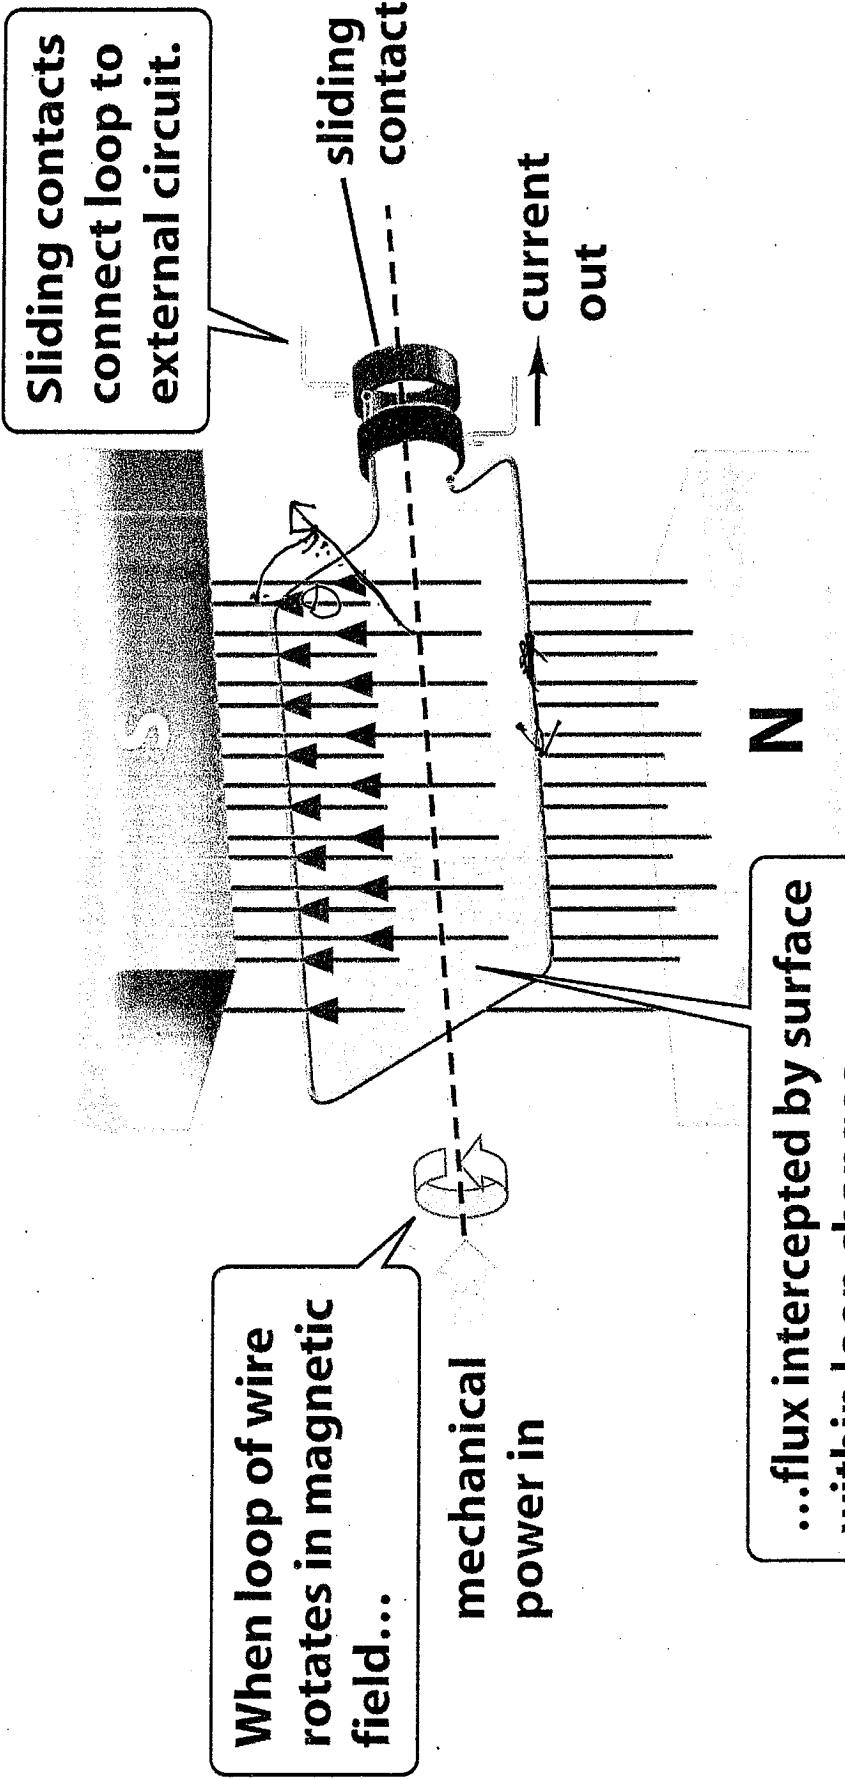

Figure 31-11 Physics for Engineers and Scientists 3/e  
© 2007 W.W. Norton & Company, Inc.

$$\mathcal{E}_m = A B_0 \cos \theta$$

$$\theta = \omega t + \theta_0$$

Induced electromagnetic torque is opposite applied torque (Lenz's law).

$$E = \omega A B_0 \sin(\theta_0 - \omega t)$$

$$\tau = \mathcal{E} I = A B_0 \frac{d}{dt} \cos(\theta_0 - \omega t) = \omega A B_0 \sin(\theta_0 - \omega t)$$

**Generator's alternating emf oscillates sinusoidally between positive and negative values.**
